# Report on the monitoring and testing of ruminants for the presence of transmissible spongiform encephalopathy (TSE) in the EU in 2008

## TABLE OF CONTENTS

1. SUMMARY.....	4
2. MONITORING PROGRAMMES, SAMPLING AND DIAGNOSTIC METHODS APPLICABLE IN 2008 .....	5
2.1. Legal basis.....	5
2.2. BSE monitoring of bovine animals.....	5
2.3. TSE monitoring of ovine and caprine animals.....	6
2.4. TSE monitoring in other animal species .....	7
2.5. Sampling and testing for TSE monitoring .....	7
2.6. Sampling and testing for the prion protein genotype determination in ovine animals.....	7
3. ANNUAL AND MONTHLY REPORTS.....	9
4. SUMMARY OF THE BSE TESTING IN BOVINE ANIMALS DURING 2008.....	13
4.1. Sampling .....	13
4.2. BSE positive cases.....	17
4.3. Testing by target group.....	26
4.4. Age distribution of BSE positive cases .....	35
4.5. Year of birth distribution of BSE positive cases detected since 2001 .....	45
4.6. Prevalence of BSE in different age categories.....	48
4.7. BSE in young animals .....	61
5. SUMMARY OF TSE TESTING IN OVINE AND CAPRINE ANIMALS DURING 2008.....	67
5.1. Sampling .....	67
5.2. Positive cases .....	71
5.3. Atypical cases.....	83
5.4. TSE discriminatory tests .....	88
5.5. Age distribution of TSE positive cases in ovine animals .....	89
5.6. Genotyping .....	93
6. SUMMARY OF TSE TESTING IN OTHER SPECIES DURING 2008.....	101

## **LIST OF ACRONYMS**

<b>AM :</b>	Ante-mortem inspection
<b>BSE :</b>	Bovine spongiform encephalopathy
<b>CWD:</b>	Chronic wasting disease
<b>DNA :</b>	Deoxyribonucleic acid
<b>EU 15 :</b>	The 15 countries that were members of the European Union before 1 May 2004
<b>EU 15(-UK) :</b>	The EU 15 except the United Kingdom
<b>EU 12</b>	The 12 countries that joined the European Union since 1 May 2004
<b>EU 27 :</b>	EU 15 + EU 12
<b>EU 27(-UK) :</b>	The EU 27 except the United Kingdom
<b>EU 27(-CY)</b>	The EU 27 except Cyprus
<b>Na:</b>	not available
<b>NSP :</b>	National scrapie plan
<b>OTM :</b>	Over thirty months
<b>TSE:</b>	Transmissible spongiform encephalopathy
<b>TSE Regulation:</b>	Regulation (EC) No 999/2001

## **1. SUMMARY**

In 2008, a total of 10 051 584 bovine, 465 276 ovine and 152 037 caprine animals were tested in the EU 27 in the framework of the TSE monitoring programmes. 125 bovine, 1 936 ovine and 1 214 caprine animals turned out positive.

1 557 871 risk bovine animals and 8 490 256 healthy animals slaughtered for human consumption were tested by rapid tests. 2 352 bovine animals were tested in the framework of passive surveillance (animals reported as official BSE suspects. In addition, 1 105 animals were tested in the framework of culling of animals with an epidemiological connection to a BSE case. 93 % of positive cases were detected by the active monitoring (testing of risk animals, healthy slaughtered and culled cattle) and 7 % were detected by passive surveillance.

No BSE cases were found in Austria, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, Greece, Hungary, Latvia, Lithuania, Luxembourg, Malta, Romania, Slovenia and Sweden. The number of BSE cases and the overall prevalence in tested animals decreased by respectively 29 % and 25 % in 2008 compared to 2007.

463 201 ovine animals were tested by active monitoring, while 2 075 were animals reported as official TSE suspects and therefore subjected to laboratory examination. In caprine animals, the numbers of tests in the respective groups were 150 566 (active monitoring) and 1 471 (TSE suspects). Some 743 and 63 TSE cases in respectively sheep and goats confirmed in 2008 were subjected to discriminatory testing. None of them have been confirmed to be BSE.

In addition, in the framework of a survey for chronic wasting disease (CWD) in cervids, as required in Commission Decision 2007/182/EC, 12 025 animals were tested between 2006 and 2008 hunting seasons. None of them turned out positive.

All Member States submitted information on the TSE testing of bovine, ovine and caprine animals. In addition to the Member States, Norway also submitted information on their TSE testing programmes.

Further information: Health and Consumer Protection Directorate-General, Unit E2; fax: +32-2-296.90.62; e-mail: SANCO-TSE-MONITORING@ec.europa.eu

## **2. MONITORING PROGRAMMES, SAMPLING AND DIAGNOSTIC METHODS APPLICABLE IN 2008**

### **2.1. Legal basis**

Animals suspected of a TSE shall be examined in accordance with Article 12.2 of Regulation (EC) No 999/2001 of the European Parliament and of the Council laying down rules for the prevention, control and eradication of certain transmissible spongiform encephalopathies as amended (TSE Regulation). The legal framework for the active monitoring of ruminants for the presence of TSE is laid down in Article 6 of TSE Regulation and specified in its Annex III Chapter A. Special testing rules are laid down in Annex III for bovine animals born in United-Kingdom before 1 August 1996 and killed for destruction pursuant to of Regulation (CE) No 716/96.

The legal basis for the sample collection and for the test methods is laid down in Chapter C of Annex X to TSE Regulation. From 2005, Annex X (as amended by Commission Regulation (EC) No 36/2005) also provides for mandatory discriminatory testing for BSE of TSE cases detected in small ruminants.

The legal basis for the testing for the determination of the prion protein genotypes is laid down in points 8.1 and 8.2 of Chapter A in Annex III to TSE Regulation.

The legal basis for the survey to detect CWD in cervids is laid down in Commission Decision 2007/182/EC of 19 March 2007 as amended by Commission Decision 2008/661/EC of 1 August 2008.

The EU legislation on TSE monitoring is summarised in Table 1.

### **2.2. BSE monitoring of bovine animals**

The monitoring of bovine animals for the presence of BSE is divided into the following target groups:

#### **(1) Fallen Stock**

Bovine animals which have died or have been killed on the farm or in transport, but not slaughtered for human consumption nor killed in the framework of an epidemic. Member States may decide to derogate from this provision in remote areas with a low animal density, where no collection of dead animals is organised. The derogation shall not cover more than 10% of the bovine population in the Member State.

#### **(2) Emergency slaughtered animals**

Bovine animals subject to "special emergency slaughtering" as described in relevant Community legislation.

#### **(3) Animals with clinical signs at AM**

Bovine animals sent for normal slaughter but the slaughter of which was deferred because they were:

- (a) suspected of suffering from a disease which is communicable to humans and to animals or showing symptoms or being in a general condition such as to indicate that such a disease may occur.
- (b) showing symptoms of a disease or of a disorder of their general conditions which is likely to make their meat unfit for human consumption.

#### **(4) Healthy slaughtered animals**

Bovine animals subject to normal slaughter for human consumption and animals without clinical signs of disease slaughtered in the context of a disease eradication campaign other than BSE.

#### **(5) Animals culled under BSE eradication**

Birth cohorts (bovine animals born in a herd within 1 year before or after the birth of a BSE case), rearing cohorts (bovine animals reared together with a BSE case during the first year of their life), offspring and any other bovine animals killed because of an epidemiological link to a BSE case.

#### **(6) Animals clinically suspected of being infected by BSE**

Bovine animals reported as suspect of TSE as defined in Article 3 of the TSE Regulation and subject to the measures described in Articles 12 and 13.

### **2.3. TSE monitoring of ovine and caprine animals**

The testing of ovine and caprine animals for the presence of TSE is divided into the following target groups:

#### **(7) Healthy animals which are slaughtered for human consumption**

Member States with major ovine population shall test an annual minimum sample size of healthy slaughtered animals over 18 months of age.

Where a Member State experiences difficulty in collecting sufficient numbers of healthy slaughtered animals to reach its allotted minimum sample size, it may choose to replace a maximum of 50% of its minimum sample size by testing dead animals at the ratio of one to one and in addition to the minimum sample size set out for dead animals.

#### **(8) Animals which are not slaughtered for human consumption**

This target group contains almost exclusively fallen stock, with a few emergency slaughtered animals and animals with clinical signs at AM which have died or been killed, but which were not killed in the framework of an epidemic or slaughtered for human consumption. There are minimum samples sizes of both ovine and caprine animals over 18 months of age.

## **(9) Animals culled under TSE eradication**

Including animals additionally tested on infected herds before culling measures were applied.

## **(10) Animals clinically suspected of being infected by a TSE**

Ovine and caprine animals reported as suspect of TSE as defined in Article 3 of the TSE Regulation and subject to the measures described in Articles 12 and 13.

### **2.4. TSE monitoring in other animal species**

Commission Decision 2007/182/EC of 19 March 2007 as amended provides for a survey to detect chronic wasting disease (CWD) in cervids to be completed no later than the end of the hunting season of 2008. The survey includes different target species and target groups.

The provision on examination of any case of TSE suspicions in Article 12 of the TSE Regulation applies to all animal species. Active monitoring in species other than bovine, ovine, caprine and cervid animals is voluntary and without further specifications.

### **2.5. Sampling and testing for TSE monitoring**

Samples collected in the context of TSE active monitoring are screened by one of the rapid tests listed in Annex X to the TSE Regulation. Confirmation tests from inconclusive or positive results in the active monitoring and analysis of samples from suspects are performed by histopathology or, if appropriate, by immunocytochemistry, immunoblotting or by demonstration of characteristic fibrils by electron microscopy.

Further discrimination between BSE and scrapie has become mandatory from January 2005 on by Commission Regulation (EC) No 36/2005. To this purpose the discriminatory immunoblottings, immunocytochemistry and enzyme linked immunosorbent assay were laid down in Chapter C point 3.2.(c) of Annex X to TSE Regulation. In addition the mouse bio-assay method has to be applied to certain samples for final confirmation or exclusion of BSE.

### **2.6. Sampling and testing for the prion protein genotype determination in ovine animals**

The prion protein genotype shall be determined for:

- (1) All TSE positive ovine animals.
- (2) A random sample of ovine animals selected from animals over 18 months of age.

The alleles were defined by reference to the amino acids encoded by codons 136, 141, 154 and 171 of the prion protein gene. Routine methods for the collection of samples and DNA genotyping are used.

**Table 1: Summary of the EU legislation on TSE monitoring in 2008**

	EU 27 (-UK)	UK
<b>Legal provisions</b>	Regulation (EC) No 999/2001 as amended Commission Decision 2007/182/EC as amended	Regulation (EC) No 999/2001 as amended Regulation (CE) No 716/96 as amended Commission Decision 2007/182/EC as amended
<b>Bovine animals</b>		
<b>Special emergency slaughter</b>	All > 24 months	
<b>Clinical signs at AM</b>	All > 24 months	
<b>Fallen stock</b>	All > 24 months	
<b>Animals slaughtered for human consumption</b>	All >30 months	All > 30 months (except those born before 1 August 1996)
<b>BSE suspects</b>	All	
<b>Other</b>		All animals born between 1 August 1995 and 1 August 1996 killed for destruction pursuant to Regulation (EC) No 716/96
<b>Ovine and caprine animals</b>		
<b>Animals slaughtered for human consumption</b>	Minimal annual sample size of animals over 18 months of age in MS with major populations	
<b>Animals not slaughtered for human consumption</b>	Minimal annual sample size of animals over 18 months of age depending on size of MS populations of ewes or goats	
<b>Animals in infected flocks</b>	Minimal sample size in animals over 12 months of age	
<b>Cervids</b>		
A minimum sample size for certain target groups in wild and farmed red deer ( <i>Cervus elaphus</i> ) and/or wild white-tailed deer ( <i>Odocoileus virginianus</i> )		
<b>Other than bovine, ovine and caprine animals and cervids: voluntary</b>		

### **3. ANNUAL AND MONTHLY REPORTS**

In accordance with Article 6.4 and as specified in Chapter B.I of Annex III to TSE Regulation Member States shall submit an annual report to the Commission on the monitoring programme performed and the outcome of it.

All this information has been electronically submitted by the Member States, and introduced and processed by the Commission in a database in order to summarise the information provided and to elaborate summary tables to be distributed within the Commission and to the Member States and Norway. The present report should be considered as a final update of the information received and as the Commission summary report for 2008 as requested by Article 6.4 of the TSE Regulation.

The target groups mentioned in this report were divided into the following categories:

(1) Bovine animals:

**(a) Active Monitoring**

- Fallen stock
- Emergency slaughter
- Animals with clinical signs at AM
- Healthy slaughtered animals
- Animals culled in connection to a BSE case.

Fallen stock, emergency slaughtered animals and animals with clinical signs at ante-mortem inspection are considered as "**risk animals**".

**(b) Passive surveillance**

Animals reported as official BSE suspects by the farmer or the veterinary practitioner and subject to laboratory examination.

The age limits used in testing different target groups of bovine animals are summarised in Table 2.

(2) Ovine and caprine animals

**(a) Active Monitoring**

- Animals not slaughtered for human consumption: risk animals containing almost exclusively fallen stock with a few tests in emergency slaughtered animals and animals with clinical signs at AM.
- Healthy animals slaughtered for human consumption

- Animals culled in a herd where an animal has been declared TSE positive including animals additionally tested on infected herds before culling measures were applied.

**(b) Passive Surveillance**

- Animals reported as official TSE suspects by the farmer or the veterinary practitioner and subject to laboratory examination.

United Kingdom	UK	United Kingdom	Royaume-Uni	Vereinigtes Königreich

In addition, results of the monthly reports of Norway (NO) are included.

## **4. SUMMARY OF THE BSE TESTING IN BOVINE ANIMALS DURING 2008**

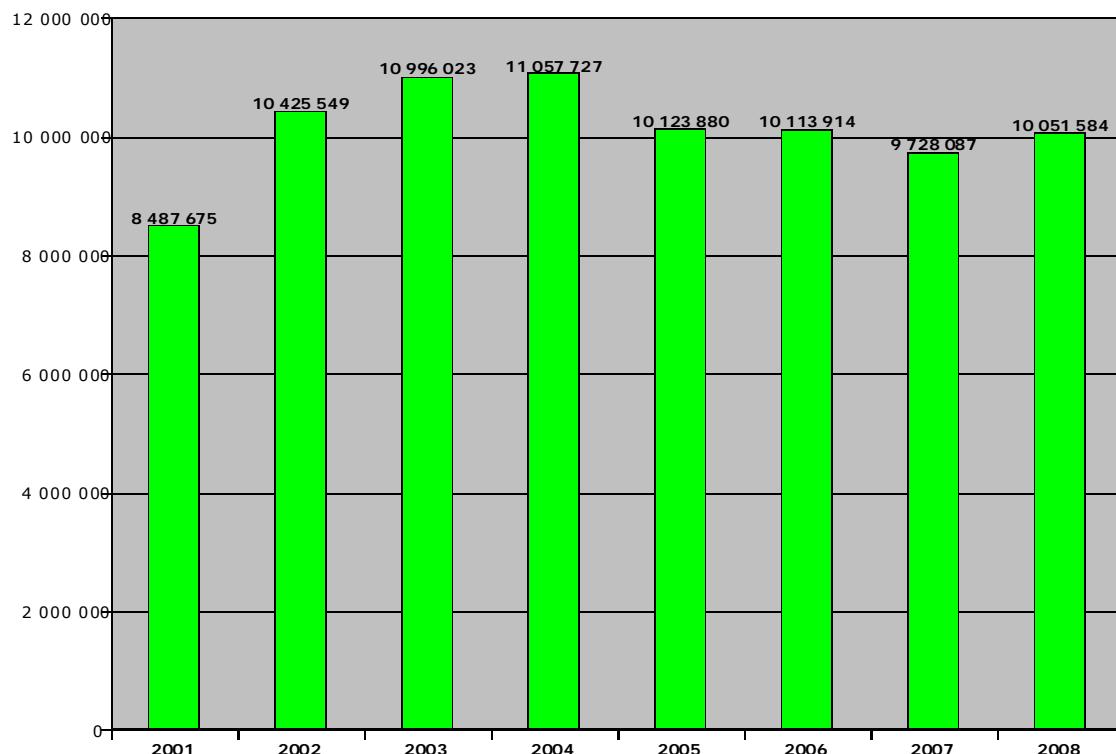

The information was extracted directly from the electronic submission of monthly reports by Member States. The monthly information is often updated and/or corrected by the Member States in following reports. The information shown in the following summaries is updated according to the information received electronically until 29 October 2009. Information on adult cattle population in 2008 was obtained from Eurostat.

### **4.1. Sampling**

#### **Comments on the sampling**

The monitoring programme carried out in 2008 was similar to the programme carried out in 2007. Over 80 million cattle have been tested in the EU since 2001. The percentage of tested risk animals and healthy slaughtered cattle compared to the adult population (Table B2) should be interpreted with caution as certain Member States were running monitoring programmes under different conditions (e.g. the United Kingdom), as additional voluntary testing of younger cattle occurred in certain Member States and as there may be a difference in risk animals, including fallen stock, per year in relation to the population because of different production systems.

**Chart B1: Total tests performed in the period 2001-2008 in the EU**

## **4.2. BSE positive cases**

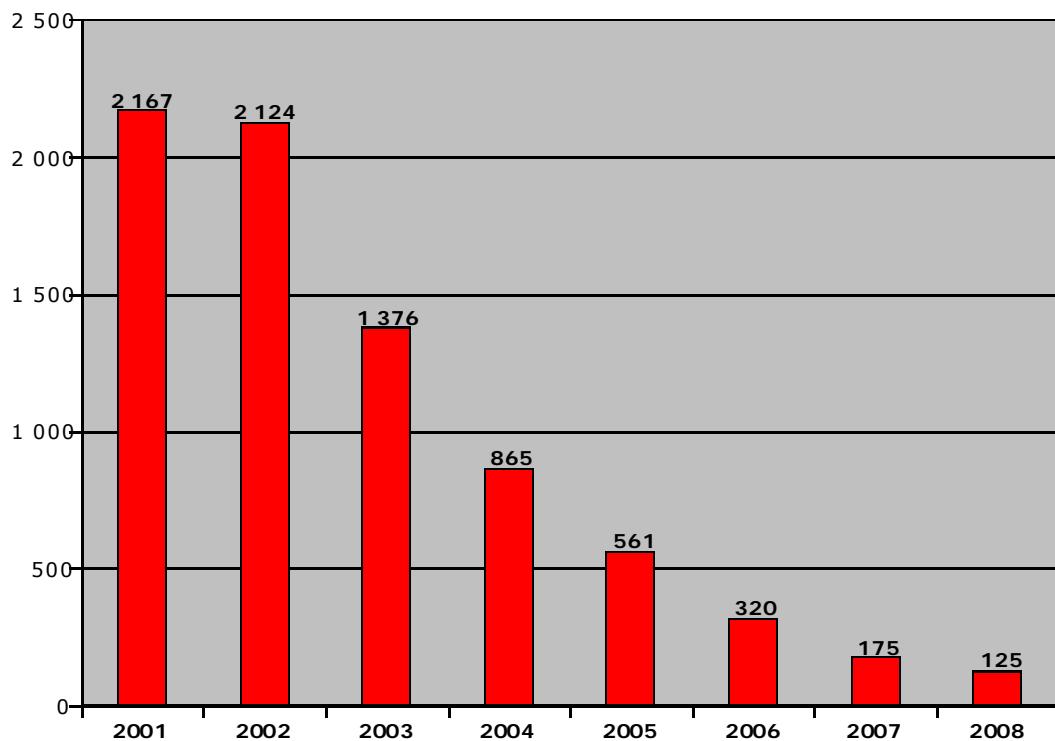

### **Comments on BSE positive cases**

When analysing the evolution of BSE positive cases, it should be kept in mind that active monitoring was limited before 2001. The expanded active monitoring became fully applicable in July 2001. The annual number of tests was about 25 % higher in the period 2002-2008 than in 2001. However, the prevalence of BSE is reducing since 2002 due to the decline in positive cases despite the number of tests carried out increased or remained stable.

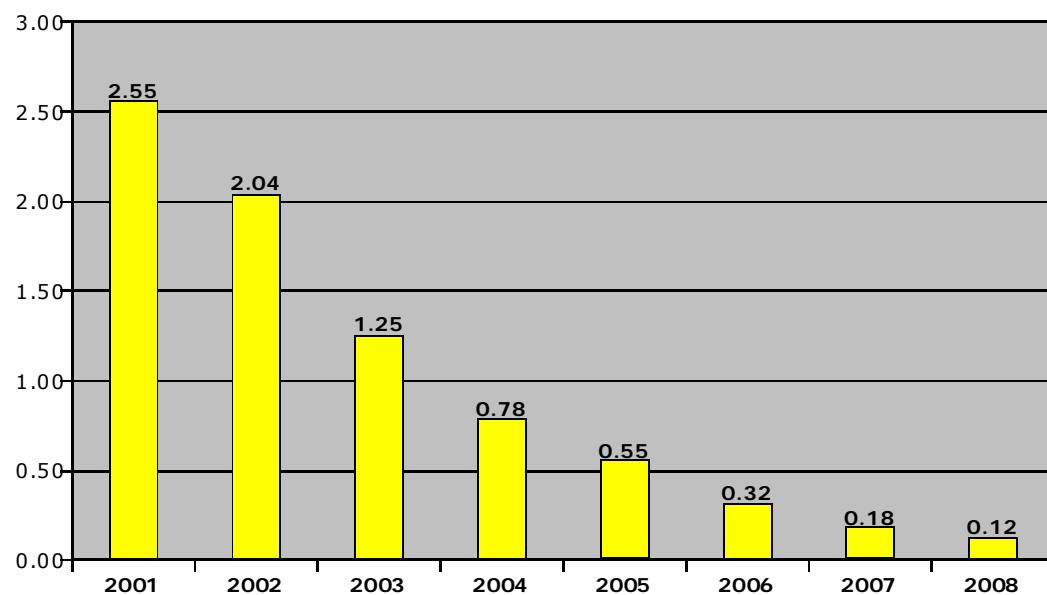

Overall the number of cases and the prevalence in tested animals (ratio of positives per 10 000 tests) of BSE dropped respectively by 29 % and 25 % in the EU in 2008 compared to 2007.

### **Evolution of the number of BSE positive cases in the EU since 2001**

**Chart B2: Evolution of the number of BSE positive cases in the EU since 2001**

**Chart B3: Evolution of the prevalence (ratio of BSE cases per 10 000 animals tested) of BSE positive cases in animals tested in the EU since 2001**

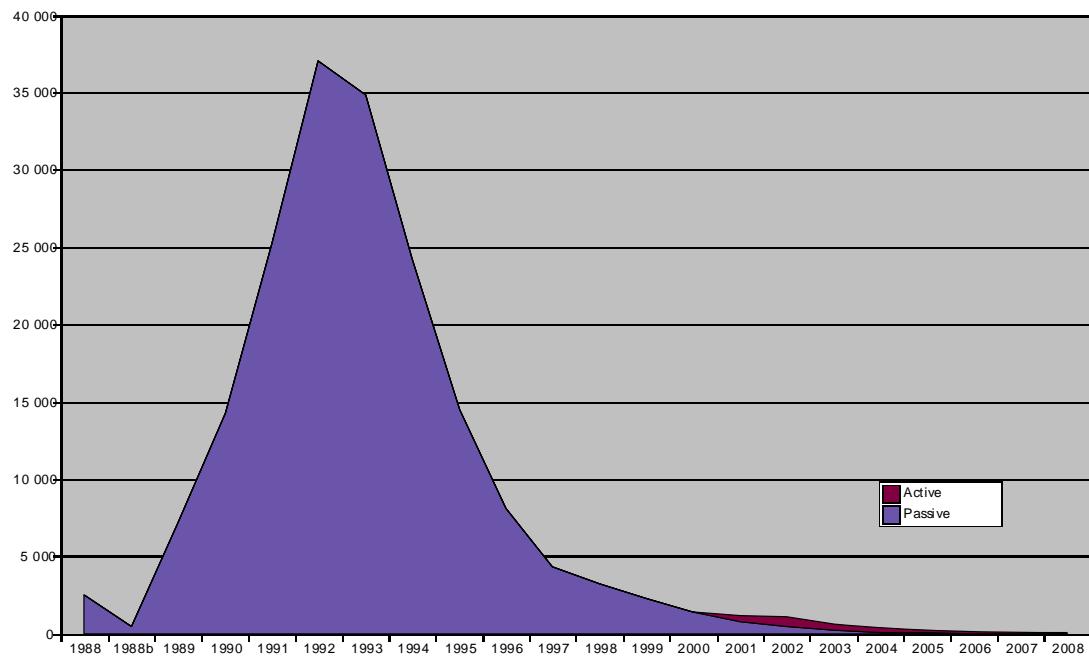

**Table B4: Evolution of positive cases world-wide since BSE was recognised**

\* positive cases per 10 000 bovine animals tested

**Chart B8: Evolution of the prevalence in tested animals per target groups of BSE cases detected by active monitoring**

### Comments on testing by target group

Figures between different Member States should be compared with caution as:

- The results of different target groups are interdependent and should not be viewed in isolation. For example, an effective passive surveillance will increase the number of cases found in suspects and may at the same time decrease the ratio of positive cases in the other target groups, in particular in fallen stock and emergency slaughtered animals. In addition the policy on emergency slaughter may vary between Member States which will have an impact on the cases detected in this surveillance stream.
- Moreover, different monitoring programmes were run in healthy slaughtered cattle. Testing younger cattle on a voluntary basis will increase the denominator and result in a lower ratio. In addition, in case of UK, the testing focussed on animals born after the date of the effective feed ban.

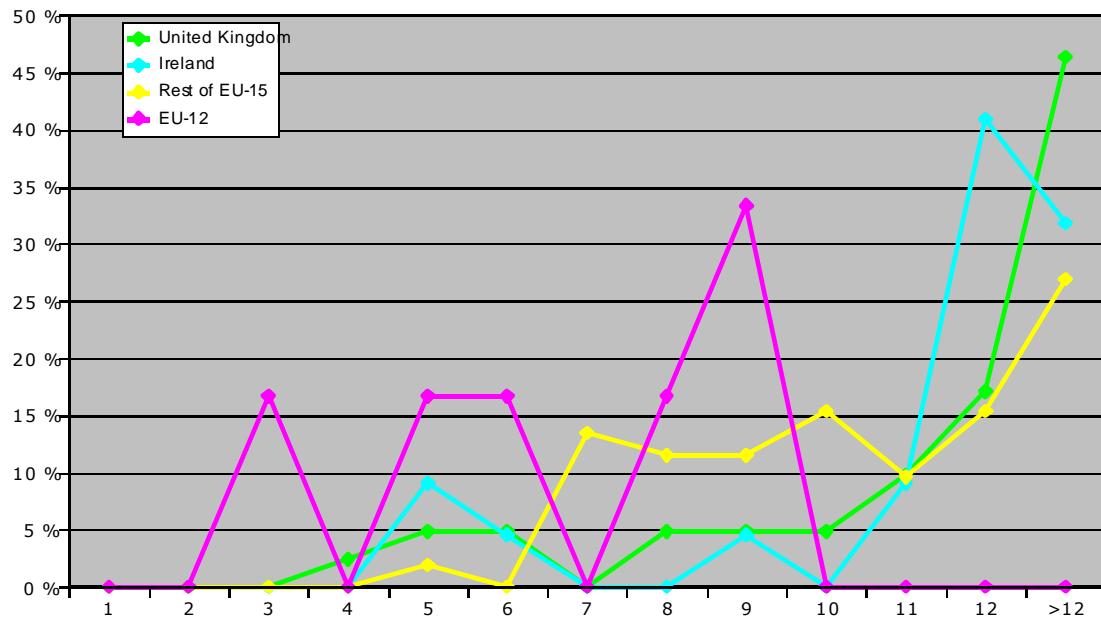

The figures illustrate that the likelihood of finding BSE cases is higher in fallen stock, emergency slaughtered cattle and cattle with general clinical signs at ante-mortem ('risk animals') than in healthy slaughtered cattle.

#### 4.4. Age distribution of BSE positive cases

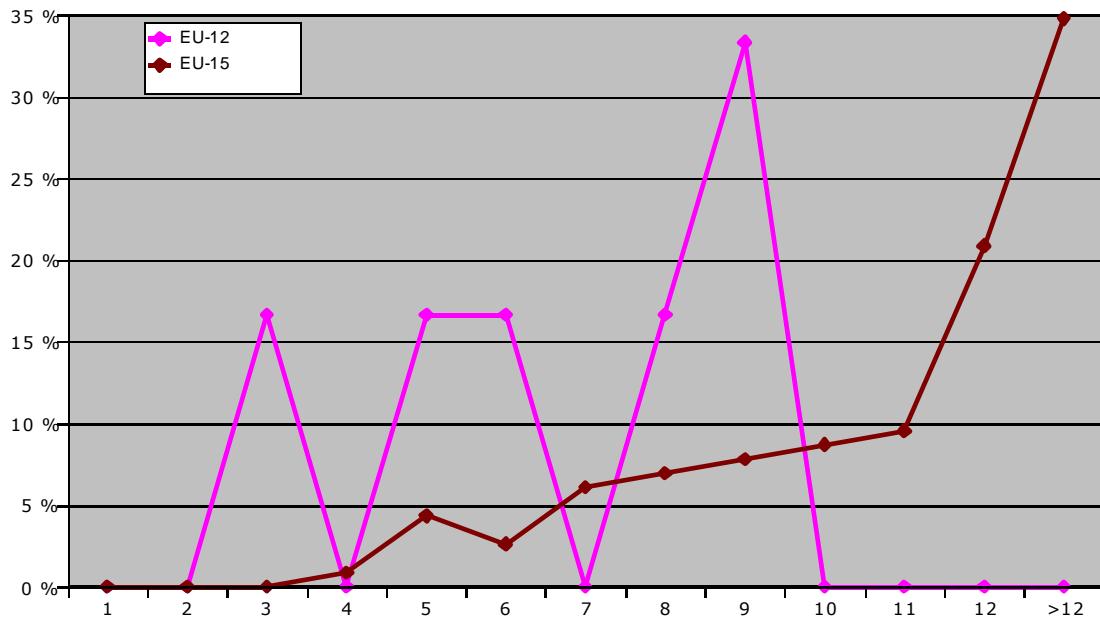

**Table B15: Age distribution (age group of months) of all BSE positive cases with known age in 2008**

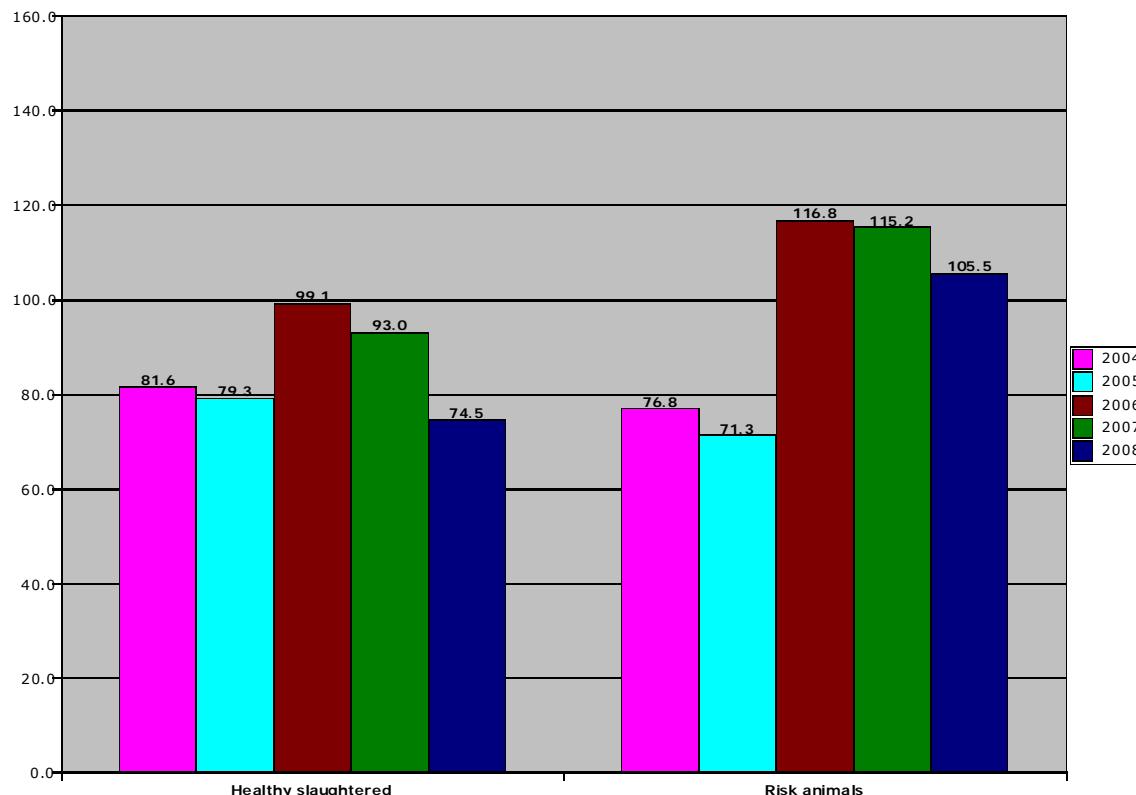

**Chart B14: Average age (in months) per target group of BSE positive cases detected in EU 27 from 2004 to 2008**

**Chart B15: Average age (in months) per target group of BSE positive cases detected in EU 15 from 2001 to 2008**

**Chart B16: Average age (in months) per target group of BSE positive cases detected in EU 12 from 2004 to 2008**

#### **Comments on the age distribution of BSE positive animals**

The previous tables and charts illustrate that there are differences between Member States in the age profile of positive cases in 2008 as was already observed in the previous years. However a favourable evolution (increasing trend) is observed in the average age of positive cases of the major target groups from 2001 to 2008. Taking into consideration an average incubation period of 5-6 years, these figures are an indication that measures taken (mainly feed ban) have been effective and that the prevalence of BSE in young animals is decreasing.

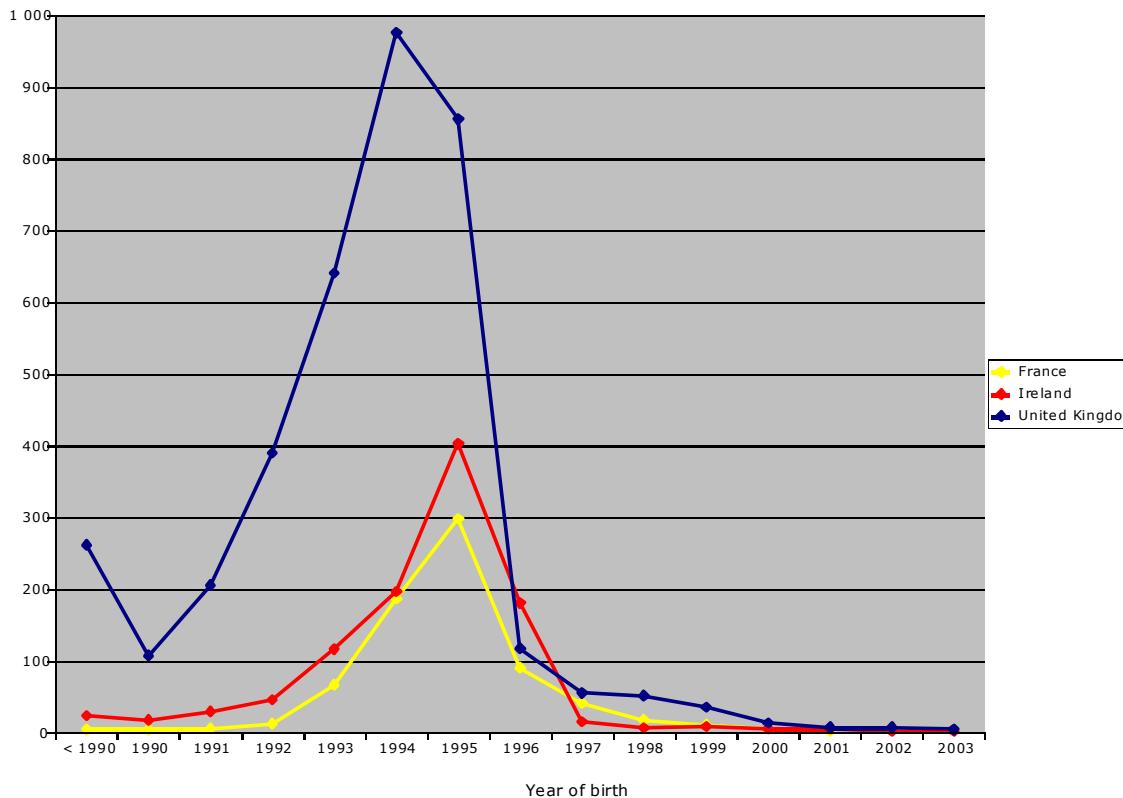

#### 4.5. Year of birth distribution of BSE positive cases detected since 2001

**Table B20: Year of birth distribution of BSE cases**

**Charts B17 and B18: Distribution of number of BSE cases per year of birth**

**Chart B17**

**Chart B18**

### **Comments on the year of birth distribution of positive animals**

The previous tables and charts only take account of cases detected since 2001 and does not include cases detected before 2001. However, differences between Member States with regard to the year of birth with the highest percentage of positive cases may be an indication of differences in the period of exposure to the agent and by the effectiveness of measures to prevent transmission of the agent, in particular the feed ban.

#### 4.6. Prevalence of BSE in different age categories in 2008

## 5. SUMMARY OF TSE TESTING IN OVINE AND CAPRINE ANIMALS DURING 2008

The information is extracted directly from the monthly reports electronically submitted by the Member States in 2008 and the information available since 2002. The monthly information is often updated and/or corrected by the Member States in subsequent reports. The information shown in the following summaries is updated according to the information received up to 29 October 2009. In 2008, Cyprus did not submit electronic reports as regards details on positive cases detected in small ruminants (i.e. age distribution of cases, type of cases, genotyping results and number of discriminatory tests performed).

### 5.1. Sampling

The total number of samples and the number of samples per target group and per Member State can be found in the following tables and charts

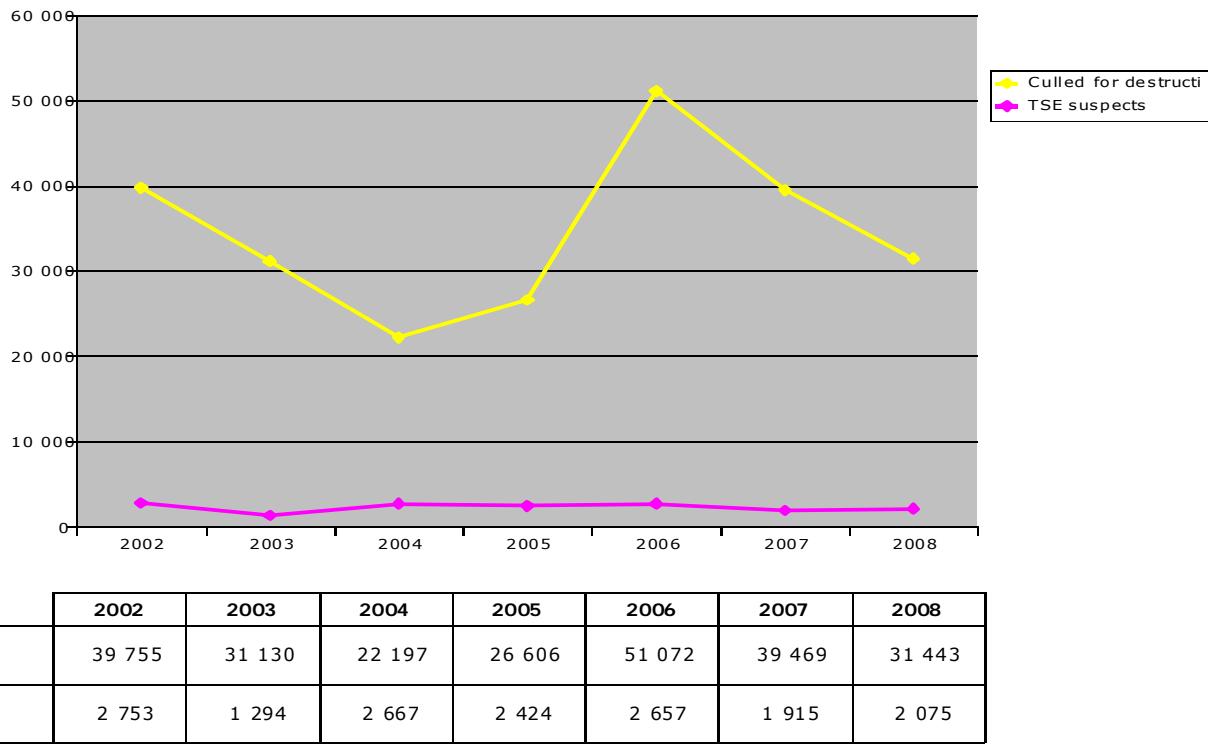

**Chart SR1: Evolution of TSE testing in sheep in the EU 27 from 2002 to 2008**

	2002	2003	2004	2005	2006	2007	2008
Slaughtered for human consumption	240 785	349 071	146 163	155 104	602 656	409 278	218 930
Not slaughtered for human consumption	70 823	110 810	142 746	171 878	404 136	414 680	212 828

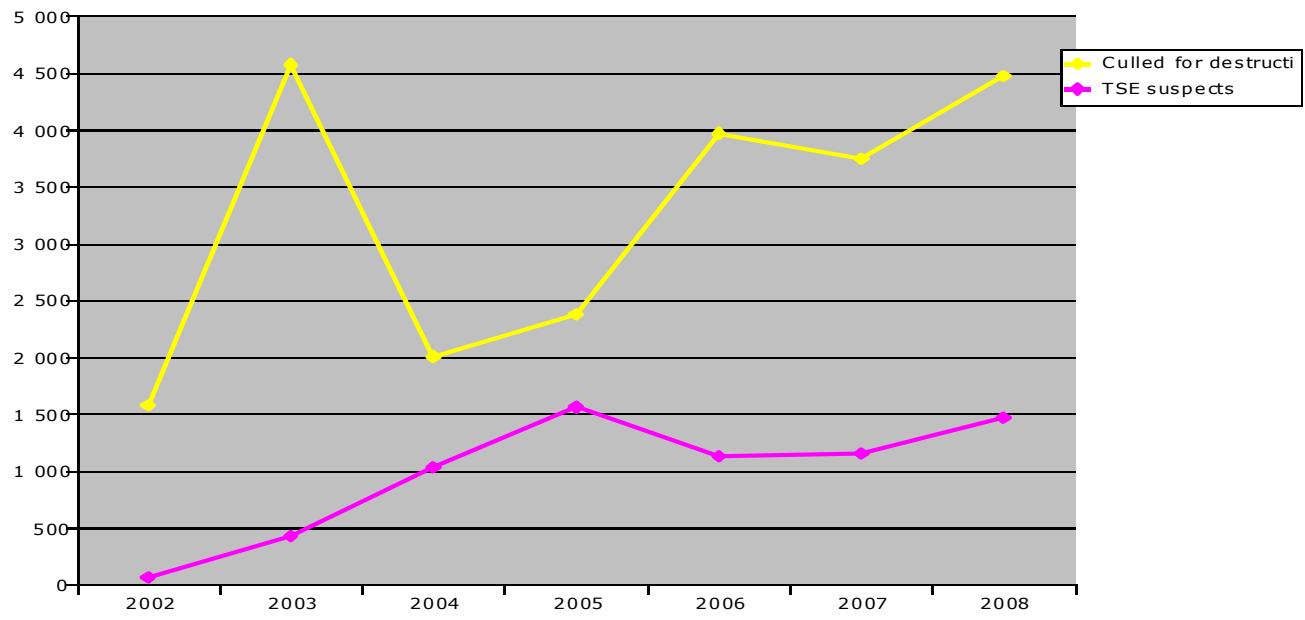

**Chart SR2: Evolution of TSE testing in sheep in the EU 27 from 2002 to 2008**

**Chart SR3: Evolution of TSE testing in goats in the EU 27 from 2002 to 2008**

**Chart SR4: Evolution of TSE testing in goats in the EU 27 from 2002 to 2008**

#### **Comments on sampling**

Overall, the number of samples in small ruminants decreased quite significantly in 2008 compared to 2007 as a consequence of the implementation since July 2007 of Regulation (EC) No 727/2007, amending the TSE Regulation, which amended the requirements for the TSE monitoring programmes for small ruminants. The number of tests carried out in the framework of passive surveillance (official TSE suspects) remained stable in relation to 2007 and previous years. The important contribution of France in the total number of tests carried out (in particular in goats) must be noticed.

## 5.2. Positive cases

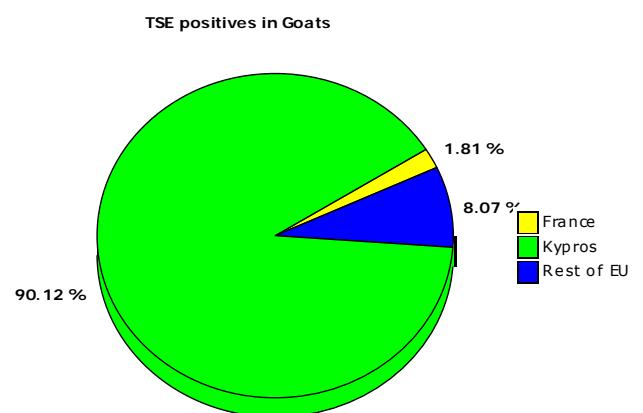

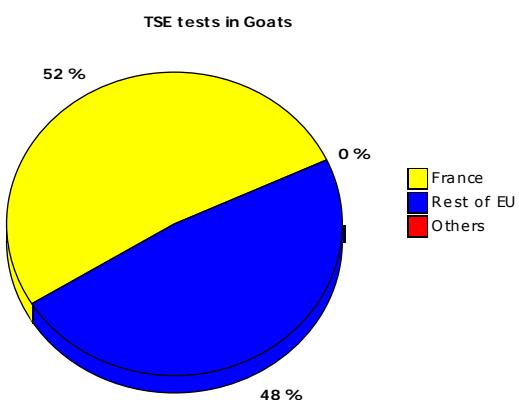

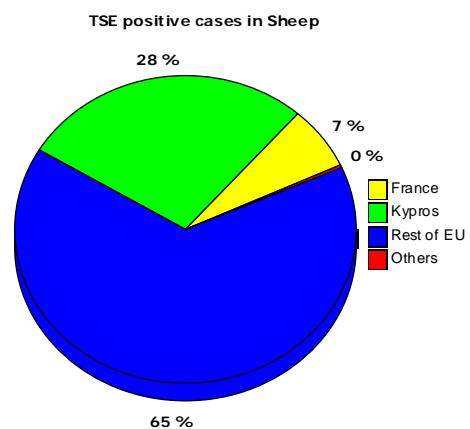

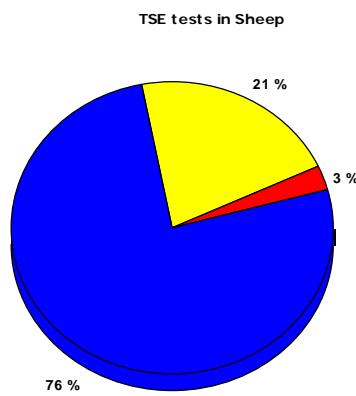

**Table SR1: Total TSE positive cases detected in ovine and caprine animals detected in 2008**

**Chart SR8: Prevalence in tested animals (cases per 10 000 tested) of positives in ovine animals not slaughtered for human consumption (risk animals) in affected Member States (and Norway) from 2002 to 2008**

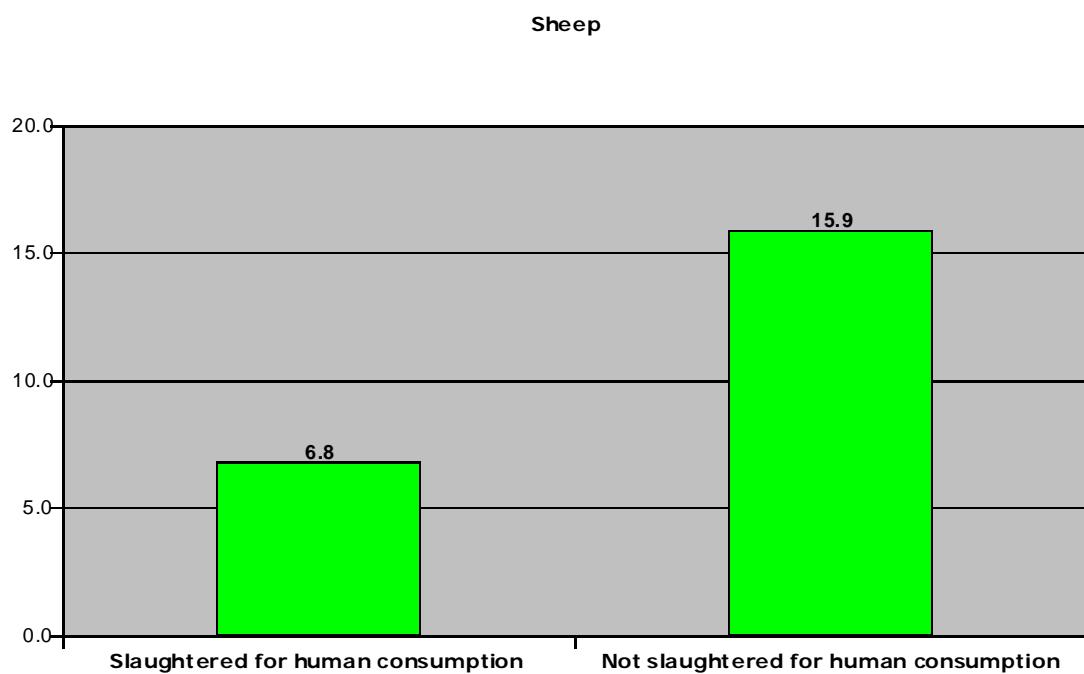

**Chart SR9: Prevalence in tested animals (cases per 10 000 tested) of TSE in healthy slaughtered and risk ovine animals in the EU 27 (except Cyprus) from 2002 to 2008**

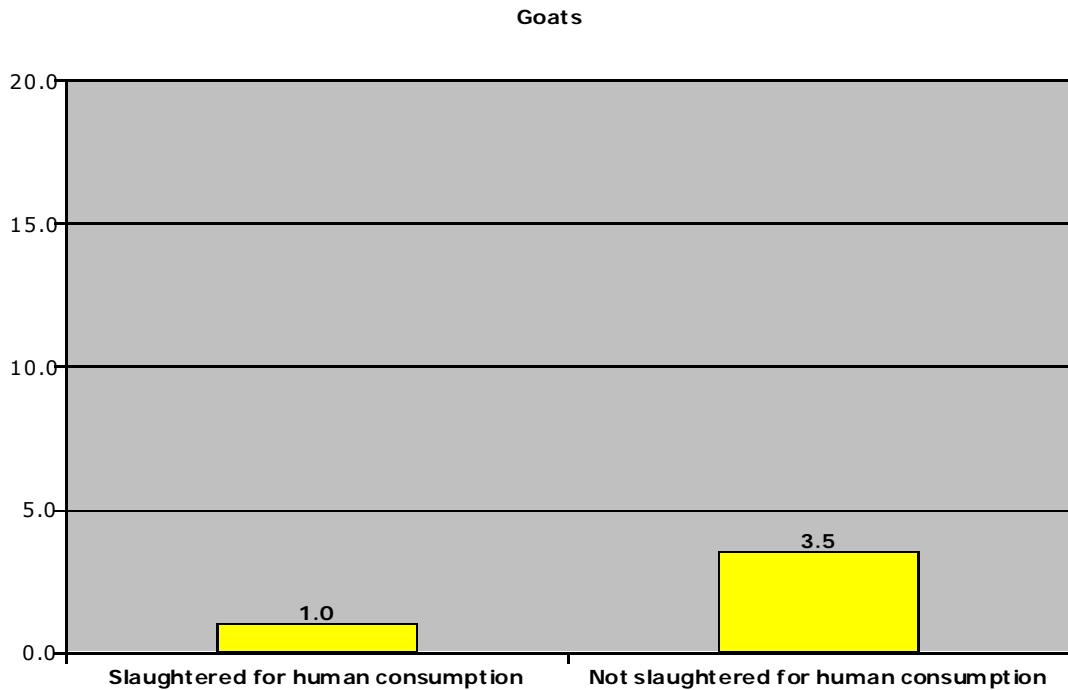

**Chart SR10: Prevalence in tested animals (cases per 10 000 tested) of TSE in healthy slaughtered and risk caprine animals in the EU 27 (except Cyprus) from 2002 to 2008**

**Chart SR11: Comparison of prevalence of TSE in small ruminants in the main target groups in the EU (except Cyprus) from 2002 to 2008**

### **Comments on positive cases**

There is still no clear trend with regard to the evolution of the prevalence of TSE in tested animals in the different target groups since the monitoring started in 2002. Prevalence in tested animals not slaughtered for human consumption (risk animals, mainly fallen stock) is higher than in healthy slaughtered sheep or goats. The prevalence of TSE in sheep is also higher than in goats.

Cyprus has a significantly higher prevalence of TSE in sheep and goats compared to other Member States.

### 5.3. Atypical cases

**Table SR8: TSE cases in small ruminants reported as atypical from 2004 to 2008 (animals culled in the frame of TSE eradication are excluded)**

### **Comments on atypical cases**

Atypical TSE cases were demonstrated in several Member States and can represent a quite big percentage of TSE cases in some Member States. Results from 2004 seem to indicate an increasing trend in the prevalence of atypical cases in tested animals, both in sheep and goats. However, the results should be interpreted with caution as the monitoring requirements have changed during this period and the testing and sampling methods have an influence on the detection of atypical cases.

The definition of atypical cases detected from 2004 to 2008 is in line with the Opinion of the Scientific Panel on Biological Hazards of the European Food Safety Authority on classification of atypical TSE cases in small ruminant adopted on 26 October 2005.

## 5.4. TSE discriminatory tests

**Table SR11: Discriminatory testing on TSE cases confirmed in sheep and goats in 2008 (Results of primary molecular testing with a discriminatory immuno-blotting (Point 3.2 c(i), Chapter C , Annex X to Regulation (EC) 999/2001)**

## 5.6. Genotyping

The genotypes found in positive cases and by random sampling were grouped in accordance with the NSP classification system used in the United Kingdom for genetic resistance to classical scrapie and BSE:

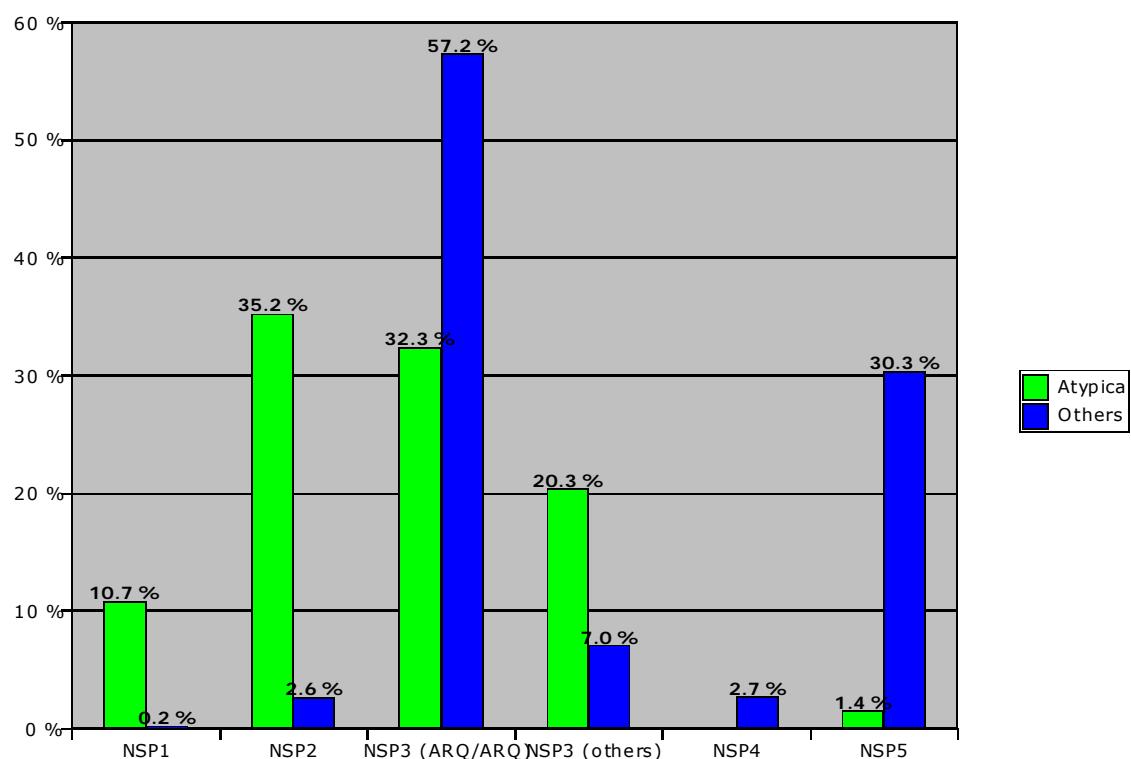

<b>NSP1</b>	<b>ARR/ARR</b>	<b>Genetically most resistant</b>
<b>NSP2</b>	<b>ARR/ARQ, ARR/ARH, ARR/ AHQ</b>	<b>Genetically resistant</b>
<b>NSP3 (ARQ/ARQ)</b>	<b>ARQ/ARQ</b>	<b>Genetically little resistance (ARQ/ARQ may be scientifically reviewed)</b>
<b>NSP3 (others)</b>	<b>AHQ/AHQ, ARH/ARH, ARH/ ARQ, AHQ/ARH, AHQ/ARQ</b>	
<b>NSP4</b>	<b>ARR/VRQ</b>	<b>Genetically susceptible</b>
<b>NSP5</b>	<b>ARQ/VRQ, ARH/VRQ, AHQ/VRQ, VRQ/VRQ</b>	<b>Genetically highly susceptible</b>

### Genotypes in confirmed cases TSE cases in accordance with point 8.1 of Chapter A.II of Annex III to the TSE Regulation

**Table SR14: Distribution of known genotypes in confirmed TSE cases in 2008**

	Known genotypes		Distribution of known genotypes					
	Number	% of TSE Positives	NSP1	NSP2	NSP3		NSP4	NSP5

## **Calculation and meaning of the odds ratio**

ARQ/ARQ was used as reference and the percentage of genotypes in random samples as controls. The odd ratio is calculated as:

*% cases in a country with a certain NSP genotype/% random samples in a country with a certain NSP genotype*

---

*% cases in a country with ARQ/ARQ genotype/% random samples in a country with ARQ/ARQ genotype*

An odds ratio higher than 1 means a higher susceptibility than the ARQ/ARQ genotype, an odds ratio lower than 1 means a susceptibility lower than the ARQ/ARQ genotypes. Using these odds ratio would however require further computing confidence intervals. The genotype distribution of atypical cases is clearly different from classical scrapie. The odds ratio provides an indication if the genotypes have a different susceptibility to an infection of respectively classical scrapie and atypical cases. The odds ratios should be interpreted with caution because the number of cases was low in most Member States.

## 6. SUMMARY OF TSE TESTING IN CERVIDS DURING 2007-2008

The information shown in the following tables is updated according to the information electronically submitted by the MS to the EU-database up to 29 October 2009.

**Table C1: Results of the survey for chronic wasting disease in farmed cervids according to Commission Decision 2007/182/EC**
